Identification of cDNA encoding the subunit of the cytochrome bc1 complex in rice (*Oryza sativa* L.). We have isolated cDNA encoding the protein subunit of the rice electron transport chain cytochrome bc1 complex by screening a cDNA library with a probe derived from the human mitochondrial cytochrome bc1 complex cDNA. This cDNA, termed *Osbc1*, contains a coding sequence of 748 bases with a length of mature protein of 583 amino acids. While a high degree of conservation in amino acid sequence was found among the protein subunits of bovine, human, and *Saccharomyces cerevisiae*, a substantial difference was observed between the amino acid sequences of the five rice cytochrome bc1 protein subunits and those of the five other organisms. Furthermore, the relative amino acid length of the rice subunits revealed a unique feature of the rice cytochrome bc1 protein subunits. DNA sequence analysis indicated that the rice cytochrome bc1 protein subunits are highly homologous to bovine, yeast, and human subunits, and that *Osbc1* has a high degree of identity with human subunit III and a low degree of identity with bovine subunits II and IV. The promoter region of *Osbc1* contained a 14-base pair consensus sequence (GCGGCCGCG) that was highly conserved in the 5' flanking regions of cytochrome bc1 subunit genes in *S. cerevisiae*, bovine, and human.
